1)write about interpreter and compiler?

A compiler and an interpreter are both system software programs that translate human-readable source code (written in a high-level language like C or Python) into low-level machine code or intermediate instructions that a computer's central processing unit (CPU) can execute.

2)write about object oriented programming approach?

Object-Oriented Programming (OOP) is a programming paradigm that organizes software design around data, or objects, rather than functions and logic. It models real-world entities by bundling their characteristics (attributes) and behaviors (methods) into single, modular units.
